Database search

A fast quantum mechanical algorithm for database search

Lov K. Grover 3C-404A, Bell Labs 600 Mountain Avenue Murray Hill NJ 07974 lkgrover@bell-labs.com

Summary

Imagine a phone directory containing N names arranged in completely random order. In order to find someone's phone number with a probability of $\frac{1}{2}$, any classical algorithm (whether deterministic or probabilistic) will need to look at a minimum of $\frac{N}{2}$ names. Quantum mechanical systems can be in a superposition of

states and simultaneously examine multiple names. By properly adjusting the phases of various operations, successful computations reinforce each other while others interfere randomly. As a result, the desired phone number can be obtained in only $O(\sqrt{N})$ steps. The algorithm is within a small constant factor of the fastest possible quantum mechanical algorithm.

This paper applies quantum computing to a mundane problem in information processing and presents an algorithm that is significantly faster than any classical algorithm can be. The problem is this: there is an unsorted database containing N items out of which just one item satisfies a given condition - that one item has to be retrieved. Once an item is examined, it is possible to tell whether or not it satisfies the condition in one step. However, there does not exist any sorting on the database that would aid its selection. The most efficient classical algorithm for this is to examine the items in the database one by one. If an item satisfies the required condition stop; if it does not, keep track of this item so that it is not examined again. It is easily seen that this algorithm will need to look at an average of $\frac{N}{2}$

items before finding the desired item.

Prime factorization

Polynomial-Time Algorithms for Prime Factorization and Discrete Logarithms on a Quantum Computer^{*}

Peter W. Shor^{\dagger}

Abstract

A digital computer is generally believed to be an efficient universal computing device; that is, it is believed able to simulate any physical computing device with an increase in computation time by at most a polynomial factor. This may not be true when quantum mechanics is taken into consideration. This paper considers factoring integers and finding discrete logarithms, two problems which are generally thought to be hard on a classical computer and which have been used as the basis of several proposed cryptosystems. Efficient randomized algorithms are given for these two problems on a hypothetical quantum computer. These algorithms take a number of steps polynomial in the input size, e.g., the number of digits of the integer to be factored.

P. Shor, SIAM J.Sci.Statist.Comput. 26, 1484 (1997)

 Table 5: Quantum factorization records

Combinatorial designs

Hadamard matrices

Matrices having entries ±1 and orthogonal columns

Existence of Hadamard matrices

Only possible for size d = 2 or d multiple of four.

Tensor product of two Hadamard matrices is a Hadamard matrix

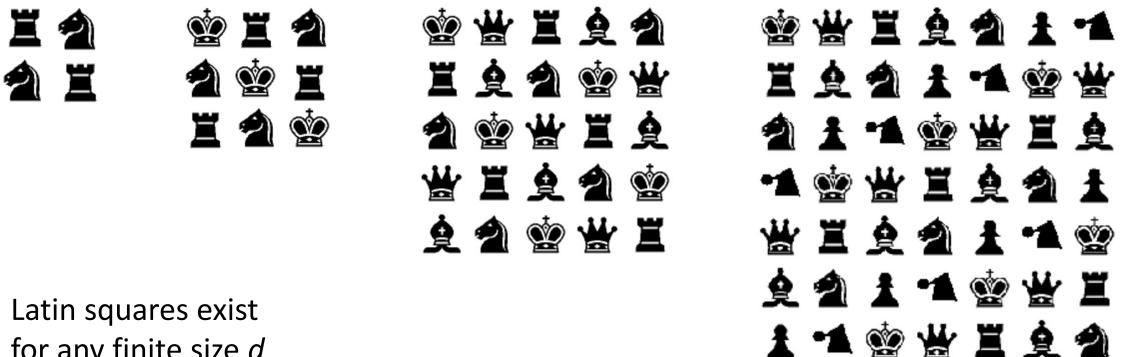

First open case is *d* = 4 *x* 167 = 668

Hadamard Conjecture

There exists a Hadamard matrix for every size d multiple of four

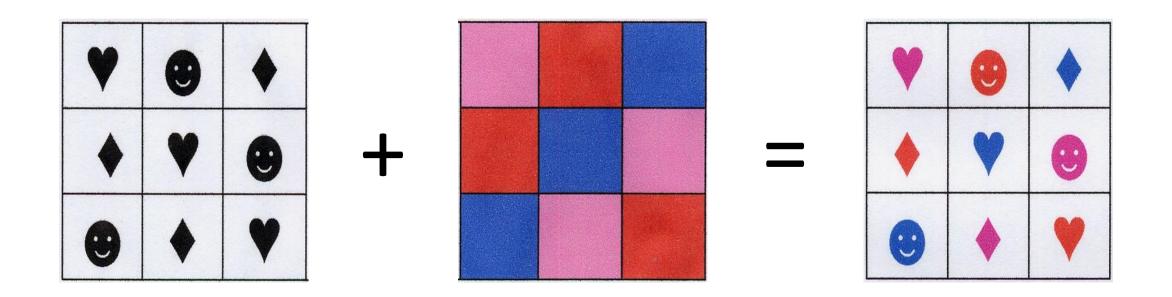

Latin squares

Square arrangements of size *d* having *d* different symbols. Symbols are not repeated along every row/column.

for any finite size d

Graeco-Latin squares

Graeco-Latin squares exist for every finite size *d>2*, except d=6

36 officers of Euler

How can a delegation of six regiments, each of which sends a coronel, a lieutenantcolonel, a major, a captain, a lieutenant, and a sub-lieutenant be arranged in a regular 6 x 6 array such that no row or column duplicates a rank or a regiment?

Euler conjectured in 1782 that such configuration is not possible.

The conjecture was proved by Gaston Tarry in 1901

An orthogonal array OA(r, N, d, k) is an arrangement of symbols taken from the alphabet {0,...,d-1}, having *r* rows and *N* columns such that for every subarray made up of *k* columns and *r* rows, all possible combination of symbols appear along the rows. Repetition of all possible combinations of symbols are allowed.

Hadamard matrices from orthogonal arrays

An OA(4 λ ,4 λ -1,2,2) exists if an only if a Hadamard matrix of size 4 λ exists

MOLS from orthogonal arrays

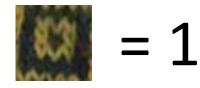

MOLHipercubes from orthogonal arrays

In general, an OA(*d^k*,*N*,*d*,*k*) determines *N*-2 MOLH of size *d* in dimension *k*

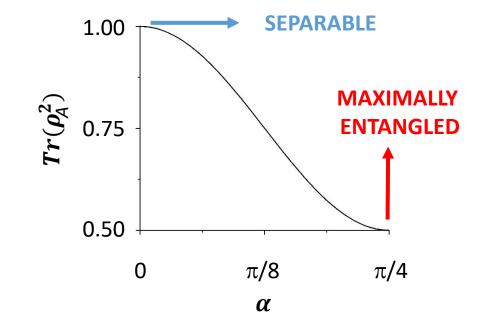

Quantum combinatorial designs

Two-qubit quantum states

A two-qubit quantum state $|\phi\rangle \in \mathbb{C}^2 \otimes \mathbb{C}^2$ is <u>separable</u> if

 $|\phi\rangle = |\phi_1\rangle \otimes |\phi_2\rangle$

Otherwise $|\phi\rangle$ is <u>entangled</u>. $|\phi\rangle = \sin \alpha |00\rangle + \cos \alpha |11\rangle$ $\rho_A = Tr_B(|\phi\rangle\langle\phi|)$

Maximally entangled states

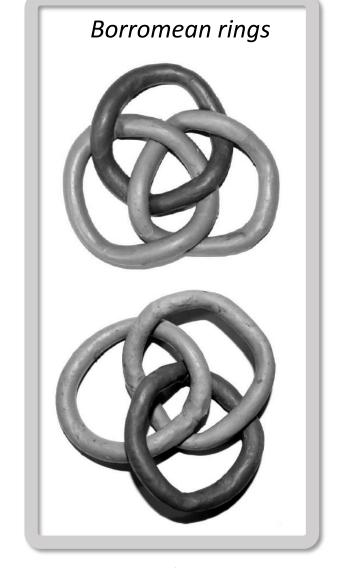

Two qubit systems

 $|Bell\rangle = \frac{1}{\sqrt{2}}(|00\rangle + |11\rangle)$

Three qubit systems

 $|GHZ\rangle = \frac{1}{\sqrt{2}}(|000\rangle + |111\rangle)$

$$|W\rangle = \frac{1}{\sqrt{3}}(|001\rangle + |010\rangle + |100\rangle)$$

I. Bengtsson, K. Życzkowski, Geometry of Quantum states Cambridge University Press (2017)

Absolutely maximally entangled states

N partite quantum pure states such that every reduction to $\lfloor N/2 \rfloor$ parties is maximally mixed

Two qubits

Three qubits

$$AME(2,2)\rangle = \frac{1}{\sqrt{2}}(|00\rangle + |11\rangle)$$
$$AME(3,2)\rangle = \frac{1}{\sqrt{2}}(|000\rangle + |111\rangle)$$
$$AME(4,3)\rangle = \frac{1}{3}(|0000\rangle + |0121\rangle + |0212\rangle + |1110\rangle + |1201\rangle + |1022\rangle + |2220\rangle + |2011\rangle + |2102\rangle)$$

Quantum orthogonal arrays

A quantum orthogonal array QOA(r, N, d, k), also denoted as $|OA\rangle$, is an arrangement composed by <u>d-dimensional quantum states</u>, having r rows and N columns such that every <u>reduction</u> to k columns forms a <u>POVM</u>.

$$OA = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} |OA\rangle = \begin{pmatrix} |0\rangle & |1\rangle \\ |1\rangle & |0\rangle \end{pmatrix}$$
$$Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |0\rangle\langle 0| \\ |1\rangle\langle 1| \\ |1\rangle\langle 1| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |0\rangle\langle 0| \\ |1\rangle\langle 1| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |0\rangle\langle 0| \\ |1\rangle\langle 1| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |0\rangle\langle 0| \\ |1\rangle\langle 1| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |0\rangle\langle 0| \\ |1\rangle\langle 1| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \\ |1\rangle\langle 1| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix} |1\rangle\langle 1| \\ |0\rangle\langle 0| \end{pmatrix} |Tr_B(|OA\rangle\langle OA|) = \begin{pmatrix}
